Esparreguera, Barcelona (Spain)

A decade solving problems across very different fields: audiovisual production, B2B technical sales and, today, coordinating a technical team. I build the tools that work needs with AI, without writing production code: judgment matters more than syntax.

EXPERIENCE

Fulgor · B2C e-commerce (Spain & EU) 2026 – present

- Product selection driven by real market data, not intuition.
- Channel automation with AI; pricing calculated by margin.

Technical Services Coordinator · Crown Lift Trucks Dec 2025 – present

- I coordinate a technical team: workload allocation, communication and cost tracking of every service call.
- Spotted that the team's workload was being split by manual judgment and built, with **Claude** and without writing production code, the engine that balances it: a working prototype validated in a simulator, on my own initiative.

Sales Specialist · Beral Projects Feb 2021 – Sep 2024

- Over **€2M** sold in three years to a high-ticket B2B portfolio, won through technical advice, not discounting.
- Technical after-sales, web content, marketing and commercial strategy.

2019–20 **Co-founder & audiovisual producer** · own production studio. Digital communication, scriptwriting, editing and production.

2018–19 **Business Consultant** · Ondas System. B2B commercial strategy for SMEs and for Vodafone at point of sale.

2016 **Audiovisual producer** · Produccions Antàrtida, S.A. Picalletres (TV3) and pre-production of Crims.

LEADERSHIP

Director of a cultural association · non-profit 2017 – 2021

- Four years leading an association of more than **70** members: activity programming and resource management.

EDUCATION

BA in Audiovisual Communication · Universitat de Lleida 2012 – 2017
Exchange at Universidade de Santiago de Compostela.

Interactive Storytelling · ESCAC 2025

Game & Concept Design · Level Up Game Dev Hub 2023 – 2024
Design document, game balancing and an original concept end to end.

MSc in Esports & Gaming Management · IEBS 2021
Event and team management in the esports ecosystem.

Routing and workload allocation engine for a technical team · Crown Lift Trucks · built with Claude

- PROBLEM**

A forklift-maintenance field team (Catalonia and the Balearic Islands) has to split its workload every day, month and year: which machine each technician takes, which route, which priority. It's a real Technician Routing and Scheduling Problem (TRSP in the literature), not a classroom exercise: every bad decision is one trip too many or one customer waiting too long.
- APPROACH**

The engine allocates in three layers that never overlap: a hard one that filters before scoring (usual technician, zone, certification), a real one that weighs proximity against workload fairness, and a tie-breaker that never pulls a machine out of its zone. It's solved by successive approximation and local search: moving and swapping pieces until there's no clear improvement left to make.
- BUILD**

I directed and built it with Claude without writing the production code myself: I don't come from code, I come from the problem. It's calibrated with the team's real productivity and travel data, not estimates, and cross-checked against the field's professional literature before any decision is trusted. Every change goes through a regression suite first: if it worsens the baseline, it isn't accepted.
- OUTCOME**

Today it's a working prototype the team uses informally, not an official company deployment. It's still alive: every improvement is tested against the baseline before it goes in.

TECHNICAL SPEC

Layers	structural (hard) · primary (proximity/fairness) · secondary (tie-break, never crosses zone)
Optimization	successive approximation + local search (move / swap)
Literature	RIME index · EDD/SPT rules · local search & Tabu Search
Regression	fixed baseline for workload fairness and mileage, on every change
Build	with Claude, no production code of my own
Deployment	versioned, build number visible

The same move repeats in everything I build: find the point where manual judgment no longer scales, and build with AI the piece that replaces it with something measurable and repeatable. I don't write production code for the pleasure of programming: I do it because it's the fastest way to test whether a process idea works before asking someone to implement it for real.
